

Daily Work Report – Analytical dashboard Module

NAME : ASWATH NARAYAN A C

1. Tasks Completed Today

- Completed an in-depth review of various sections of the platform to understand user movement and feature flow.
- Identified multiple UI irregularities and behaviour deviations across modules.
- Studied the requirement specification to gain a clear understanding of the expected analytics functionality.

2. Work in Progress

- Continuing to evaluate platform pages to detect additional bugs or inconsistencies.
- Compiling a refined list of doubts to strengthen clarity on event processing and overall analytics logic.
- Further analysing how each feature contributes to user engagement tracking.

3. Understanding of the Module

- The module focuses on capturing user behaviour across the platform, including clicks, navigation, interactions, and tool usage.
- Each recorded event must contain structured details such as timestamp, user ID, session ID, event category, module identifier, and metadata.
- The admin dashboard will showcase insights like user activity trends, high-engagement features, time-based usage patterns, and session metrics.
- Includes filtering capabilities based on date range, user classification, and feature grouping.
- Also supports exporting analytical data for extended evaluation.

4. Questions Raised

- Which user actions qualify as key events that must be tracked?

- How do we differentiate between high-priority events and general user interactions?
- What mechanism determines how session duration is calculated?
- What specific user groups will be included under dashboard filtering?
- How frequently should the dashboard analytics refresh to reflect updated data?
- Under what scenarios should certain events be avoided or not logged?
