

Daily Work Report – ARBE Module

- Dhanu Shree R

1. Tasks Completed Today

- Identified and reviewed multiple bugs on the rhofi.com website to understand platform behaviour and improve user experience.
- Completed a detailed review of the ARBE (Automated Research & Blog Engine) requirement document to gain clarity on module objectives.
- Analysed key sections of the SRS to understand the expected automation flow and content-generation logic.

2. Work in Progress

- Continuing to inspect the website to detect additional bugs or UI inconsistencies.
- Further analysing the ARBE SRS document to strengthen understanding of the workflow, signal types, and system behavior.
- Preparing a refined list of observations and basic questions that require further clarification from the team.

3. Understanding of the Module

- The ARBE module focuses on automatically identifying financial signals and converting them into short, readable content pieces.
- Signals may include market movements, stock events, mutual fund insights, and macroeconomic updates.
- Each detected signal will trigger a predefined content template and generate an AI-driven draft.

- The workflow includes stages such as draft creation, review, approval, scheduling, publishing, and user notification.
- Admins have the ability to edit, regenerate, schedule, and approve drafts before final publication.

4. Challenges Faced

- What data fields should each signal type include?
- How are the signal thresholds decided?
- What is the basic structure expected for content templates?
- When does scheduling come into the draft workflow?
- Are there any specific writing or tone guidelines to follow?
- How should the data schema connect with the signal logic?
