

REPORT BY PAVATHARINI

Daily Work Report – Usage & Engagement Analytics Module:

1. Tasks Completed Today

I went through the company website and noticed some bugs and inconsistencies across different pages.

I also spent time understanding the Usage & Engagement Analytics module more deeply by reviewing the requirement document and tried to understand how the platform currently works.

2. Work in Progress

I am continuing to check different pages to identify bugs and areas that may need improvement.

I am also working on clearing my doubts related to the module and getting more clarity on how each part of the analytics system should function.

3. What I Understood About My Module

The module is mainly focused on tracking how users interact with the platform—such as page views, clicks, searches, watchlist actions, portfolio simulations, etc.

Every event needs to be captured with important details like timestamp, user ID, session ID, event type, module name, and additional metadata.

The admin dashboard will show key insights like daily/weekly/monthly active users, the most used features, session duration, and a heatmap showing when users are most active.

The dashboard should also support filters (like date range, user type, feature category) and provide an option to export data as a CSV.

4. Questions Raised

1. What exactly counts as an event that needs to be tracked?
2. How do we decide which user actions should be recorded as important events?
3. How is the user's session duration calculated?
4. What user types are available for filtering in the dashboard?
5. How often does the analytics dashboard refresh its data?
6. Under what conditions should an event be logged and when should it be ignored?
